Sonny Huynh

Full-Stack Software Engineer

Software Engineer with 5 years of experience architecting scalable, fault-tolerant systems across full-stack and cloud environments. Specializes in Ruby on Rails and .NET with a track record of designing self-recovering systems and diagnosing complex, infrastructure-level failures at scale. Leverages AI-powered development tools like Claude Code, building custom AI skills and workflows to accelerate delivery, testing, and code quality . Combines deep technical expertise with pragmatic, business-aware architectural judgment, and experience mentoring developers and bridging technical and non-technical teams.

Skills

Programming languages: Ruby | JavaScript |Python | C#
Frameworks: Ruby on Rails | .NET | Django | Flask
Infrastructure: AWS | Azure |Kubernetes | Pulumi | GitHub Actions | Azure DevOps | Heroku

Work Experience

Carvana, Arizona, Software Engineer II | 11/2025 - Present

- Led new project end-to-end including initial research, technical plannings, task delegation across 8 engineers, on-site field testing at a vehicle inspection center, multi-phase national rollout, and user feedback collection.
- Engineered .NET backend microservices for a business-critical iOS application using a Backend-for-Frontend (BFF) architectural pattern to decouple client and domain logic.
- Architected fault-tolerant enterprise systems favoring pragmatic, tailor-fit designs to engineer auto-recovery and graceful degradation around designated points of failure (e.g. Kafka, Azure, Kubernetes outages).
- Diagnosed a legacy service's recurring cascading outages as SNAT port exhaustion and enforced end-to-end cancellation token propagation, eliminated unsafe parallelization, and ensured fast-fail connection cleanup to establish 99.9% uptime.
- Developed internal tooling to autonomize external warranty repair submissions to SilverRock Automotive, improving an existing manual process and reducing human error by 90%.

StrongMind, Arizona, Senior Software Engineer | 01/2024 - 04/2025

- Designed and implemented a custom AWS SQS-based de-duplication queue, reducing duplicate student interaction events by 73% and eliminating tens of thousands of redundant processes, saving the company from significant compute costs.
- Optimized 19 SQL calls using a query plan analyzer, improving application and API load times by an average of 63%.
- Integrated OpenAI into two Ruby on Rails applications, building course generation tools and a teacher chatbot to improve existing course building processes and to provide real-time examination feedback.
- Authored RESTful APIs and ETL pipelines in Ruby on Rails, .NET, and Python to support applications and microservices.
- Mentored, taught, and paired with 7 junior developers, contributing to the promotion of 5 team members.

StrongMind, Arizona, Software Engineer | 05/2021 - 12/2023

- Increased test coverage across 4 Ruby on Rails applications to 90%+, improving reliability, maintainability, and productivity.
- Migrated a high-traffic database from Azure CosmosDB to PostgreSQL AWS RDS using Python ETL pipelines, lowering read and write costs by an average of 50%.
- Consolidated cloud infrastructure by migrating all Azure resources to AWS, eliminating cross-cloud messaging issues and streamlining resource management.
- Integrated OAuth 2.0 via a custom IdentityServer4 fork, enabling seamless student data integration across internal and external applications.

Education

B.S. in Computer Science, Graduation Year 2020
Arizona State University, Arizona
Dean's List, AAPASC Coalition Liaison

Projects

PayPal/Static-site-generator
Developer and documenter for Static-site-generator, an experimental plugin for Gatsby which provides templated generation of e-commerce websites integrated with PayPal checkout - React, Node.js.
